## Erratum

### Interaktion Lamotrigin/Valproinsäure

Zum Beitrag „**Pharmakotherapeutische Strategien bei der emotional-instabilen Persönlichkeitsstörung vom Borderline-Typ**“ von I. Nowak, G. Juckel und M. Brüne (*Psychopharmakotherapie* 2019;26:128–35):

Der Satz „Lamotrigin induziert den Abbau von Quetiapin, andererseits kann sein Abbau durch Valproinsäure beschleunigt werden.“ (S. 131) ist in Bezug auf die Interaktion Lamotrigin/Valproinsäure leider falsch. Richtig ist: Der Abbau von Lamotrigin wird durch eine gleichzeitige Behandlung mit Valproinsäure *verlangsamt*, sodass es zu erhöhten (bis zu 3-fach) Lamotrigin-Spiegeln kommen kann, da Valproinsäure die Glucuronidierung von Lamotrigin hemmt und dessen Halbwertszeit daher mehr als verdoppelt wird (von ca. 33 h auf ca. 70 h; vgl. Fachinformation).

Wir bitten um Entschuldigung für das Versehen.
